Management Summary

As the payments value chain is maturing, retail prices for online payments are steadily dropping, while the level of service offered to merchants is only increasing. Consequently, payment providers aim to gain scale and increase capabilities through strategic acquisitions, constantly reshaping the payments ecosystem. This report describes the global payment solutions provider space today, defines the capabilities offered by the different participants in the ecosystem, and presents the dynamics of this space constantly shaped by innovation and consolidation.

Our commitment

Here, at The Paypers, we are aiming to provide clear perspectives on the ever-changing commerce and payments environment, in order to help professionals and industry players stay abreast of all these developments and understand the opportunities that arise. With that in mind, we created *Who's Who in Payments – Complete Overview of Key Payment Providers*, a relevant source of reference and a must-read about the payments industry.

The first edition of the report tackles some of the key trends that are relevant for merchants, payments professionals, and not only – such as the size of the ecommerce market and the development of the payments ecosystem, the latest innovation in payments and essential trends to watch, the payment landscape of 2020, the M&A activity in the payments space, and more. These topics prove to be very relevant in mapping today's payments ecosystem, as they can help determine the most successful path and the right partners.

Structure

Who's Who in Payments – Complete Overview of Key Payment Providers is structured in five parts, and it also encloses a concise glossary of the jargon and terms used by the industry.

The first part focuses on presenting the industry and describes the evolution of the payments landscape, with a particular focus on the rapidly-changing ecommerce payments market, as well as the M&As in the payments industry. Raluca Constantinescu, content editor at The Paypers, investigates what drives growth when it comes to the ecommerce payments space and elaborates on the size of this market, with the end goal of providing a concise overview of the main regional developments. This expert opinion is followed by the one delivered by Innopay about the payment landscape of 2020, which covers seven domains of interest within the payment ecosystem and depicts the main developments in this space since 2017. The next expert opinion is written by Anda Kania, senior editor at The Paypers, who charts the main mergers and acquisitions in the payments industry from 2019 to 2020, in order to provide a clear picture of the greatest deals and the rationale behind them. In this section, we also listed and analysed some of the most significant acquisitions and strategic investments in the payments industry. The first part concludes with the expert opinion provided by Equistone Partners Europe on how private equity will drive payments consolidation in 2020, considering the multiple strategic rationales that drive the ongoing consolidation of the payments industry.

The second part has a special focus on startups and, based on the investments received by these businesses and the solutions they offer on the market, we have created a list of startups to watch in the future. We had the opportunity to discuss with the Netherlands-based startup WL Payments, a Newgen-launched company that provides solutions for online payments, ecommerce optimisation, and fraud prevention – and they revealed the background of their core team, their value proposition, their key customers, and the main problems in the market they aim to solve, all of this information gathered in the form of an interview.

The third part focuses on choosing the right payments partners and it features an insightful expert opinion on this topic provided by STRATGranat. Catherine Tong and Rossini Zumwalt elaborate on the key things to consider when it is time to choose a payments partner and the importance of careful consideration prior to taking this step. →

Management Summary

The fourth part focuses on mapping the key players in the payments space and providing a comprehensive overview of the ecosystem. As this industry gets more complex, choosing the right payment partner for a business can be both difficult and vital. With this in mind, we have compiled several solution providers with their capabilities and displayed them via a concise infographic and a mapping. By depicting the key features of each company, we aim to help merchants and payment professionals grasp the current market opportunities, by providing an accurate picture of what the companies' offerings look like and by displaying their main capabilities.

The fifth part includes a section dedicated to company profiles, and it is designed to provide our readers a thorough overview of the different products and services offered by each company featured. This part is rich in details such as key players' geographical presence, core services offered, unique selling points, and business partners. The detailed mapping of PSPs will link to these profiles.

We invite you to explore our Who's Who in Payments – Complete Overview of Key Payment Providers to find the right insights that will help you figure out the payment landscape of today, but also discover the latest innovation in payments and essential trends that will shape this industry in 2020 and beyond. It is a comprehensive overview, and any merchant, payment service provider, or enterprise leader is sure to gain the knowledge they require to get ahead.

Enjoy your reading!

Today's Payments Industry – an Overview

The Paypers

What Everybody Ought to Know About the Size of the Ecommerce Payments Market

About Raluca Constantinescu: Passionately curious, Raluca is fascinated by the way in which technology and innovation impact our lives, and she is always keen on discovering the latest trends in the payments industry. After graduating in Foreign Languages and Literature, Raluca developed a genuine passion for editorial activities, having an extensive background in editing and publishing.

Raluca Constantinescu ▪ *Content Editor* ▪ The Paypers

Today's payments and commerce ecosystem, impacted by technology, innovation, regulation, and regional developments, is constantly changing and getting more complex than ever before. In this article, we will look into what drives growth when it comes to the ecommerce payments space and we will present the size of this market, with the end goal of providing a concise overview of the main regional developments and specificities.

The growth of the ecommerce payments market

The ecommerce market has grown steadily for years, with continuous further growth expected. According to Statista, in 2019 the retail ecommerce sales worldwide totalled USD **3.53** trillion, and they are expected to reach USD 6.54 trillion in 2022. Moreover, as online shopping keeps on gaining in popularity and as the range of devices with internet connections available to online shoppers has diversified, Statista forecasts that in 2021 over **2.14** billion people worldwide will buy goods and services online – up from 1.66 billion global digital buyers in 2016. The preferred device for placing orders has remained the desktop PC, but mobile purchases are catching up. Currently, two-thirds of the world's unbanked citizens have access to a mobile phone, and mobile ecommerce sales worldwide are forecasted to total USD **3.56** trillion by 2021.

How is the ecommerce payments ecosystem changing?

In the past decades, multiple payment methods started to emerge in order to cater for the shoppers' needs in different verticals. According to Worldpay's **Global Payments Report 2020**, in 2019 the preferred global ecommerce payment method was the digital/mobile wallet, with 41.8%, followed by credit card with 24.2% and

debit card with 10.6%. The report predicts that the share held by digital/mobile wallets will increase by 2023 to 52.2%, while the shares of the following two payment methods will decrease to 18.8% (credit card) and 8.8% (debit card). In this context, in Europe, Strong Customer Authentication as an intrinsic part of PSD2's agenda intends to enhance the security of online payments and reduce payment fraud, in order to protect the consumer by adding an extra layer of security – and the main challenge is implementing these requirements while also offering a smooth, frictionless user experience.

Getting more people access to payments is on the front burner, and some of the key drivers shaping the ecommerce payments market are technological development, changing customer behaviour, financial inclusion, regulation, and innovation. It is fascinating to understand what drives innovation in this industry, which are the reasons behind the expansive growth of the payments market, what is currently happening in different regions around the world, and how the emergence of the super apps that have payment as a key functionality might influence this market in the following years. Versatility is the key feature that all the super apps have in common, and that is one of the reasons why they are part of their users' everyday lives. Whether we are talking about WeChat, Alipay, Grab, or Go-Jek, these apps provide a variety of services (messaging, shopping, booking, ride-sharing, and more) via one sign-in and one user experience. →

Other key features of the super apps are the fact that they provide payment services as well (relying on their reach, but also their reputation to consolidate trust among customers), offer invisible payments, and enable customers to make transactions in a smooth manner, via just one app. And companies continuously try to find new ways in which to enrich the customer experience, all with one goal in mind: data. Super apps are not present just in China and Southeast Asia; the West is also showing signs of movement in a similar direction – however, the pace is a bit slower here, mainly due to regulatory constraints.

According to the [Global Payments Report 2020](#), China has become the largest consumer market worldwide, and the company projects that it will occupy this position through 2022 – followed by the US and the UK. In terms of growth rate, [J.P. Morgan](#) argues that the markets worldwide that will enjoy 20%+ growth rates by 2021 for the B2C ecommerce market are Indonesia (34.6% and an ecommerce market size of USD 13.6 billion), India (26.5% and an ecommerce market size of USD 36.5 billion), and Malaysia (24.0% and an ecommerce market size of USD 4.0 billion) – closely followed by Vietnam (18.9%), Mexico (12.6%), and Thailand (12.5%).

Asia–Pacific, galvanising the world of payments

With all the new technologies and market participants, the increasing complexity of the payments' regulation, the adoption of contactless tech, mobile payments, and the latest innovations in the payments landscape, disruption and growth characterise this space. Simply put, the adoption of digital payments is influencing our lives and reshaping societies around the world, by redefining commerce, bringing convenience, and providing a sense of security. And it seems as if the countries that understood this are benefiting from it.

The Asia–Pacific region remains the hotspot of the ecommerce market. Here, millions of new consumers start buying online every year – not only in the developed markets, such as Japan, Singapore, or Australia, but also in emerging markets, such as Vietnam or Malaysia –, making this region the centre of the global ecommerce payments market.

Considering the major developments in China's retail payments, it comes as no surprise that the emergence of giant ecosystem players, such as the super apps WeChat Pay or Alipay, has boosted the growth of digital payments (especially via mobile phone) in the country. However, if one looks deeper into this region that registered a major growth rate, India most certainly stands out. With a population of approximately 1.3 billion (the second largest population in the world after China), the age distribution balance in India is leaning in favour of the younger age [bracket](#).

According to JP Morgan's ['2019 Global Payments Trends Report – India Country Insights'](#), India also catches the eye for its high number of app downloads, which grew by 165% between 2016 and 2018, leading to completed ecommerce sales. J.P. Morgan further reports that shopping apps in particular registered a major growth as well, and mobile commerce became a preferred ecommerce method.

The National Payments Corporation of India (NPCI) has played a major part in this scheme. It launched the Unified Payments Interface (UPI) in 2016, supporting innovation and financial inclusion, while also encouraging inhabitants to use digital payments. [According to NPCI](#), in 2020 there are 144 banks live on UPI, and users can pay via this system at many online merchants, whenever UPI is displayed as a payment option. The Reserve Bank of India also supported this initiative, further driving consumer adoption – by adjudging that payments made via UPI would be free of charge for the first few years, by inviting banks to be a part of this system, and by supporting the interested merchants with request to pay, in-app, and QR [payments](#). That is one of the reasons why India has registered great progress over a short period by transforming its payments infrastructure and providing a streamlined user experience. →

Key developments in Latin America

There are financial inclusion initiatives in Latin America as well, and the central bank of Brazil has announced recently that in November 2020 it will launch an instant payments platform called **PIX**. The platform will be available to the entire population, and it is expected to enable Brazilians to transfer money 24/7, making it easier to carry out transactions via QR code technology and via identification methods such as phone numbers, email, and national ID numbers – therefore, data will enable the payments, which will be credited instantly. Consequently, the adoption of account-to-account (A2A) payments will most probably see an increase in Brazil.

In Latin America, with a population of 356 million, an online population of 218.3 million, and internet penetration reaching 61%, ecommerce keeps on expanding. The economic environment in this region might still present some challenges, but the ecommerce payments market has grown in recent years, the total value of online commerce in Argentina, Brazil, Chile, Colombia, Peru, and Uruguay being worth USD 41.22 billion – according to PPRO's **'Payments and e-commerce report' for Central & South America**. The smartphone penetration reached 53%, the banked population 62%, while retail payments have grown in dominance to a 63% share, up from 59% in 2013, according to **McKinsey & Company**.

The high smartphone penetration rate sets the scene for further technological development in this region, and we can definitely expect revolutionary changes to happen. Some super apps candidates have already emerged. One of them is Mercado Pago, the payment arm of the Argentina-based marketplace Mercado Libre. At first, it enabled payments between the different users from the marketplace, but it didn't stop there, and today it offers a broad range of financial services. Another worthy candidate is Colombia-based startup Rappi, which started by offering food delivery services. After significant investment rounds, Rappi has become a unicorn in record time, and has opened a financial services unit in October 2018, Rappi Pay. Today, it operates throughout the region, in countries such as Brazil, Argentina, Chile, Uruguay, Peru, Mexico, and Colombia.

The status of the ecommerce payments market in Europe

In Europe, digital payments for ecommerce are used by millions of people across the continent. Ecommerce in the Eastern European markets is growing at an average rate of 19%, with 3.6% of all retail sales made online, according to **PPRO**. When it comes to Western Europe, analysts predict that the number of users who will start looking online for items at a discount (rather than on the high street) will increase in the near future – and Euromonitor International expects ecommerce to account for 14% of all sales in Western Europe by **2021**.

Europe's case is slightly different due to the regulatory changes happening in the region, but as ecommerce becomes safer, growth is bound to happen. Some of the main factors that impact the digital payments space in Europe, besides regulation, are financial inclusion, request-to-pay (R2P) functionalities, and the rise of new technologies (such as NFC, VR, or AI).

The status of the ecommerce payments market in North America

In North America, the growth in the ecommerce payments space is driven mainly by competition, with giant players sustaining the pace of progress – a progress that is still slightly decelerated by mature technology infrastructures. With an ecommerce market that is worth more than USD 808 billion, growing at a rate of 13% a year according to **PPRO**, the most common online payment method in the region is the credit card (57% share of the ecommerce payments market), followed by e-wallets (with a 22% market share).

In this region, super apps are not an important part of the ecommerce payments market landscape yet, but some internet giants have displayed some attempts to encompass the super app model in the West. Nonetheless, a real user demand for the super app model does not seem to manifest in North America for now. →

Key developments in Africa and the Middle East

In Africa and the Middle East, there are many differences among countries when it comes to payments, politics, and economy, and ecommerce represents only 4% of the region's retail market, with a credit card penetration of 12% and an internet penetration of **55%**, according to PPRO. When it comes to online sales in the region, super-platforms like Jumia in Nigeria, Kilimall in Kenya, and Takealot in South Africa are paving the way for international ecommerce companies that want to enter the market. However, technological developments are taking place and global trends impact this region as well. Some of these developments in the ecommerce payments landscape are the implementation of blockchain, the use of QR codes, and the adoption of e-wallets – even if the most common way to pay for online purchases is by card (44% market share) and the traditional payment methods are still dominant when it comes to online payments and ecommerce across Africa and the Middle East.

Final thoughts

Most probably, technological trends, regulation, and innovation will continue to impact the ever-changing ecommerce payments landscape, while the players in this industry will strive to provide a smooth user experience to customers worldwide. All things considered – it will be interesting to see what the next decade has in store for the ecommerce payments market!

Innopay

Payment Landscape 2020: Faster, Connected & Diversified

The previous description of the Payment Landscape's evolution featured in The Payers' Payment Methods Report 2017 covered seven domains of interest within the payment ecosystem. This chapter revisits these seven domains and depicts the main developments since 2017.

The payment ecosystem and infrastructure continue to transform through increasing speed, connectivity and increasingly diversified transaction services. Therefore, besides the seven domains, two new domains are introduced. As depicted by domain 8 (figure 1), the infrastructure layer is being innovated as alternative infrastructures are being introduced. At the same time, the payment ecosystem is diversifying its traditional payment services with alternative transaction services, as will be further illustrated in domain 9. The transformations within the seven domains and the two new domains will be discussed in the remainder of this chapter.

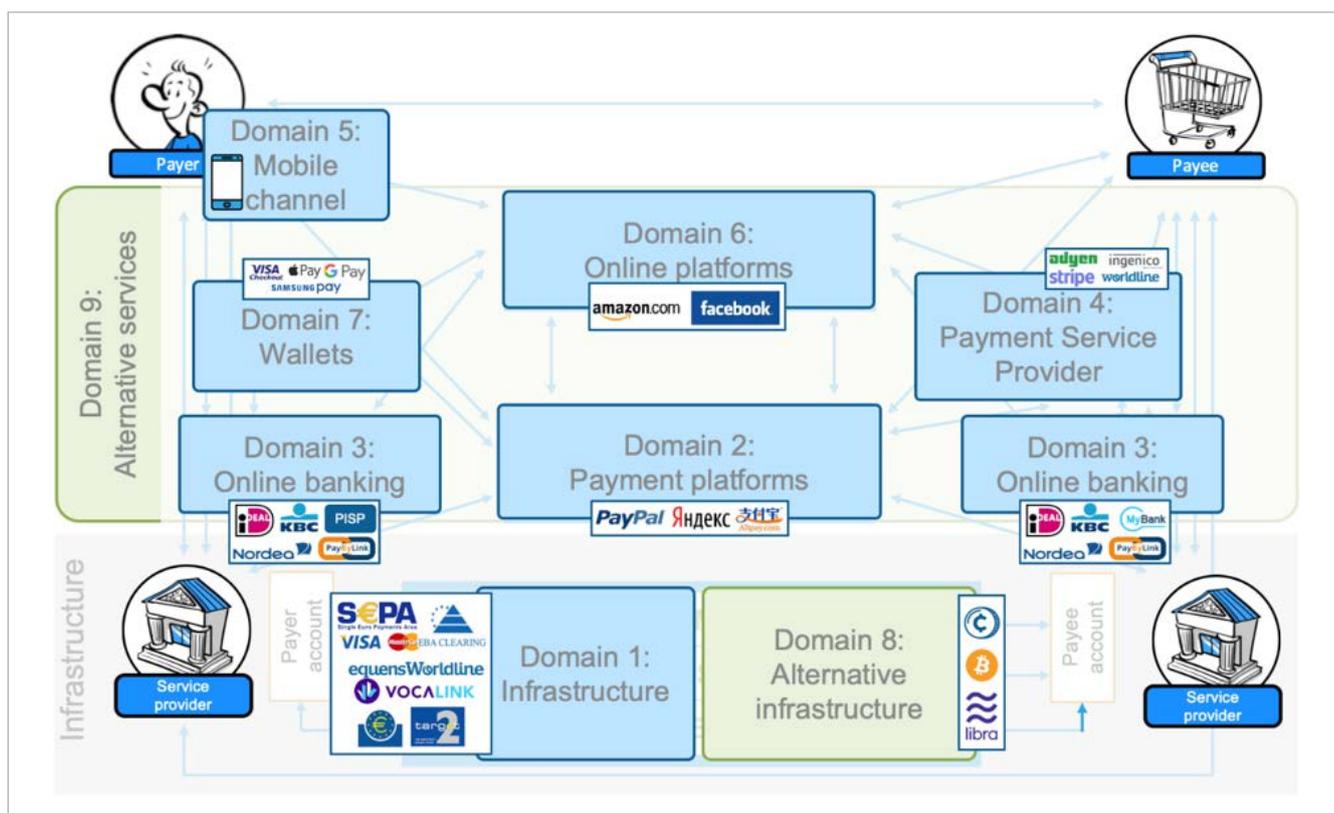

Figure 1: Interconnected domains in the payment ecosystem

→

Innopay

Domain 1: Digitalisation of payment infrastructure

Domain 1 covers the digitalisation of the payment infrastructure. Infrastructure encompasses ‘instruments’ (initiating money transfers via payment methods such as cards and SEPA Credit Transfers (SCT)), ‘processing’ (consisting of netting and clearing payments) and ‘settlement’ (settling funds via central banks).

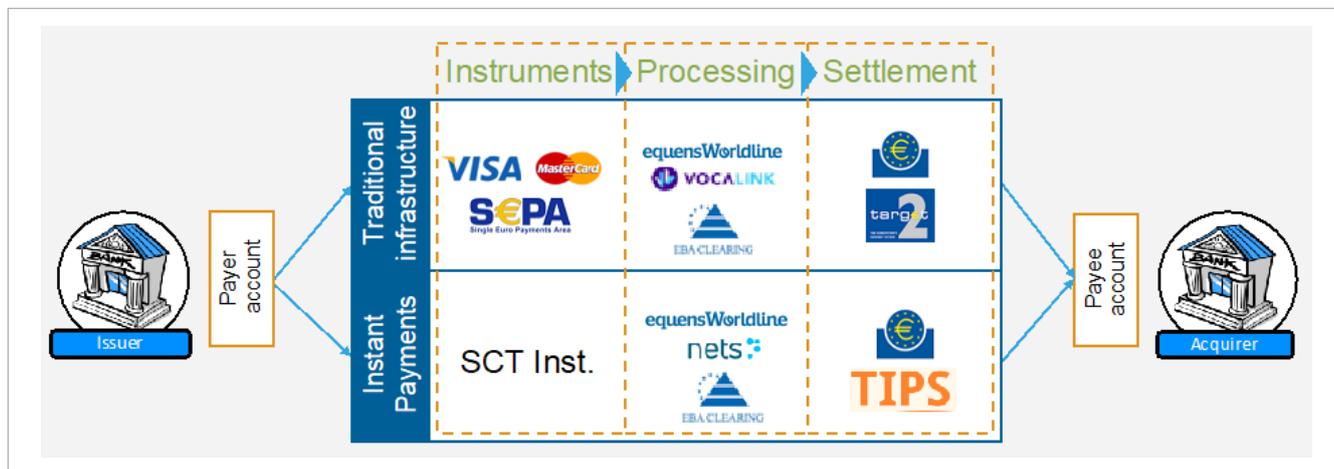

Figure 2: Traditional infrastructure enriched by new infrastructures

As depicted in figure 2, a new infrastructure capable of instant processing (on a 24/7/365 basis) of payments is gaining traction on both demand and supply side as it is increasingly positioned as the “new normal”. The traditional payment infrastructure is aimed at batch processing and involves cut-off times (eg no processing after 17.00 or on the weekends). The transition to instant payments modernises the systems, lowers cost and enables new services by facilitating per transaction processing, 24/7 and 365 days per year. So far, more than 45 countries have already moved towards faster or real-time payments and at least 25 more are working on it.

While this movement towards faster payments has already been happening for over a decade (eg UK’s Faster Payments system launched in 2008), the more recent launch of the European SEPA SCT Instant scheme and SWIFT’s GPI Instant service marks a development towards cross-border real-time payment services between connected banks (SCT Inst within SEPA, and SWIFT GPI from SEPA to other areas). Given the rise in consumers’ and corporates’ needs for quick settlement globally and the ongoing regulatory ‘push’ for faster payments, more banks are expected to follow by implementing instant payment capabilities. Instant payments is an important development for Europe as a key strategic building block to respond to the dominance of card schemes and the increasing popularity of - and growing dependence on - alternative payment networks.

→

Innopay

Domain 2: Platforms on top of payment infrastructure

Domain 2 covers payment platforms, which facilitate the 'purchase' step in the customer journey of the payer. Besides initiating the required money transfer via connected traditional payment instruments (facilitating 'payment'), payment platforms enable different variations on the 'transaction trinity' (each transaction consists of an agreement, payment and delivery step) as illustrated in figure 3. While agreement and delivery usually are outside the scope of actual payment, payment platforms provide increasingly more options to manage timing and order of payment and delivery to ensure a trusted transaction between payer and payee, for instance withholding payment to the merchant until a product has been delivered to the payer.

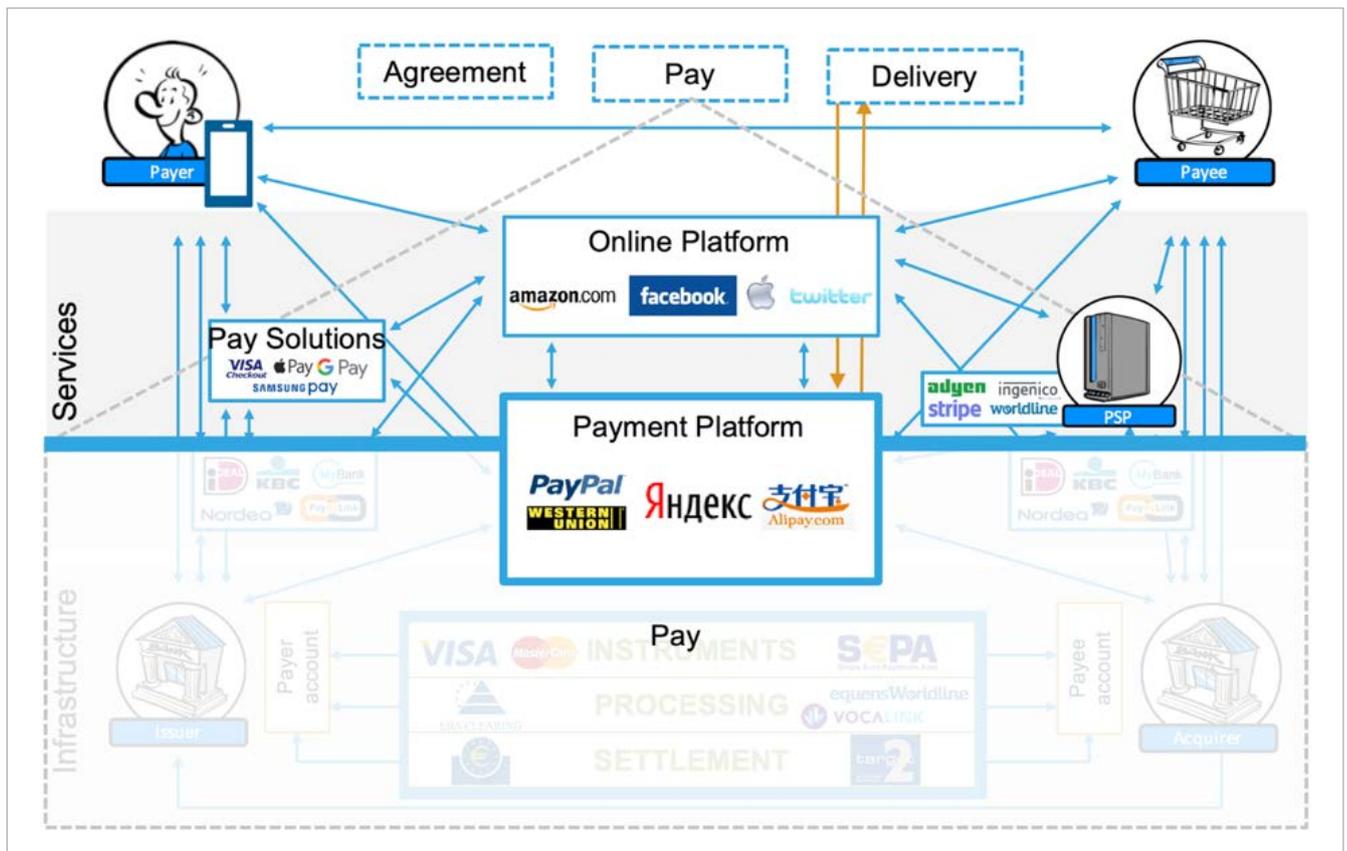

Figure 3: Payment Platforms facilitate a variety of 'purchase' flows by managing pay and delivery

Payment platforms developed their functional capabilities to support a larger variety of transaction types. Examples include Yandex's peer-2-peer payments and PayPal's consumer credit offering.

Next to functional developments, consolidation of platforms is taking place (eg acquisition of Chinese GoPay by PayPal to increase their presence in the Chinese market and relevance for Chinese merchants) as a method to increase reach and volume of payment solutions. Increasing competition between platforms fuels consolidation via mergers and blurs boundaries. In order to stay relevant, players choose different strategic paths, eg acquire capabilities to strengthen geographical footprint, to specialise in specific merchant segments and verticals or expand service portfolio with value-added services. More on this development in domain 4.

→

Innopay

Domain 3: Online Banking ePayments

Domain 3 covers the development of banks and banking communities offering online banking services to initiate electronic Payments (OBeP) from one bank account to another. Overall, there were two types of OBeP solutions: monobank solutions and multibank schemes (such as iDEAL).

An important addition is the third-party payment initiation interface as required by the revised Payment Service Directive (PSD2). Banks are mandated to expose at least one interface (and a fallback mechanism, where required) to facilitate payment initiation by licenced third parties. These third parties require a specific PSD2 licence for the role of Payment Initiation Service Provider (PISP), which is a regulated role under PSD2. Note that third party providers initiating payment directly from payment accounts is not a new phenomenon. Players like Sofort and Trustly, for instance, have managed to build strong positions in selected markets with their business models. These players will now be regulated as PISP under PSD2.

Other developments in this domain are the customer journey improvements for customers by both non-banks and banks, as illustrated by figure 4. Banks are now developing their monobank solutions with improved journeys themselves such as in-app person-2-person (P2P) payments.

Another interesting development is using OBeP at the physical POS – banks and non-banks are developing propositions to enable POS payments through the mobile banking app. For example, Payconiq is developing POS payment propositions (directly linked to payment accounts with various banks in the BeNeLux and Germany) through QR codes that can be scanned via the Payconiq mobile app. Other examples include TWINT (CH), MobilePay (Nordics) and Bizum (ES).

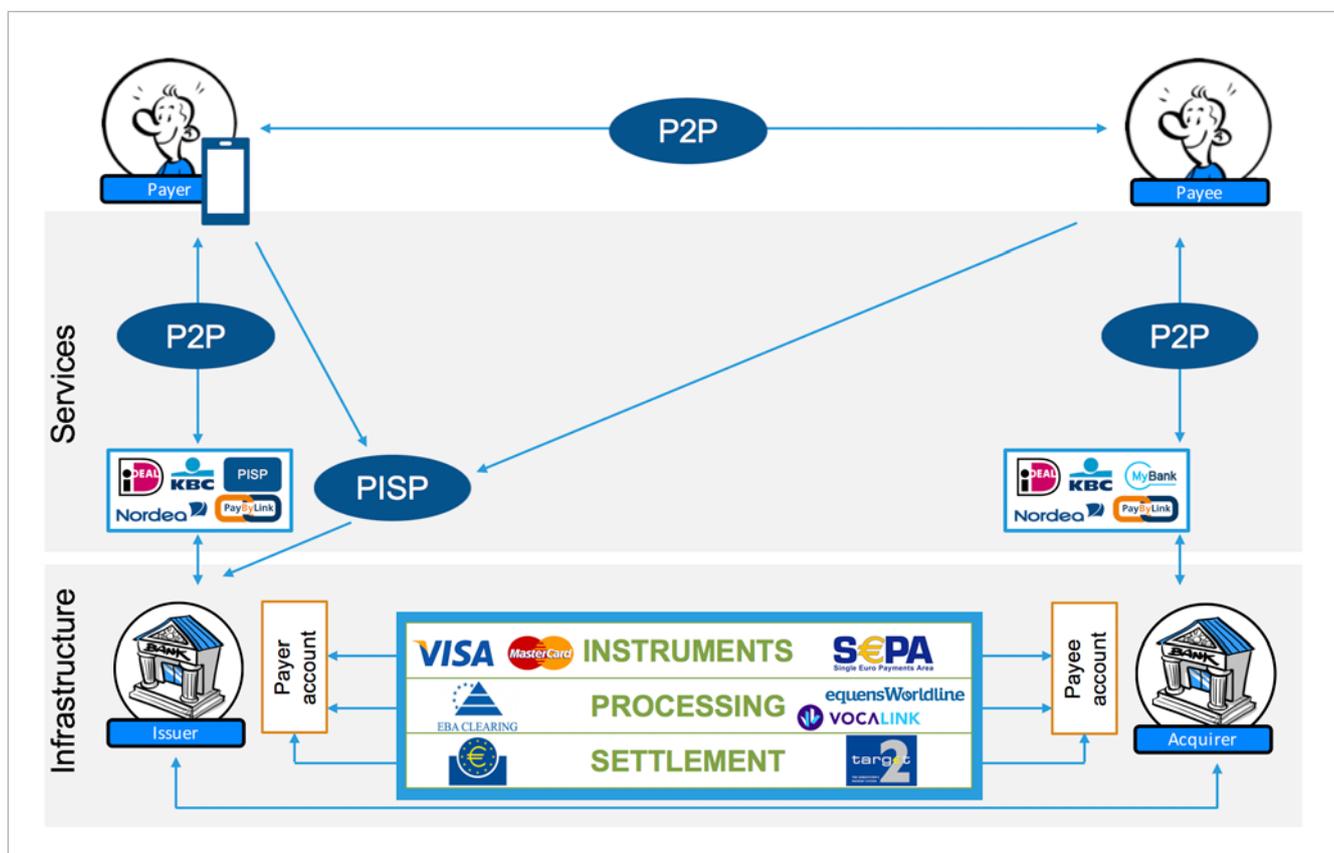

Figure 4: P2P payments simplify the customer journey for payments between consumers

→

Innopay

Domain 4: Payment Service Providers offering simplicity to merchants

Domain 4 covers the role of Payment Service Providers (PSPs), and mainly focuses on aggregating payment methods and offering easy access to these methods for payment acceptance by merchants.

The PSPs market for core payment transaction processing services is maturing, evidenced by the increasing price pressure faced by hundreds of incumbent PSPs and the strong drive towards consolidation. Staying on top of the game is challenging with the ever-evolving consumer and merchant payment needs. PSPs are pursuing various strategic paths to cope with the changing market dynamics:

1. Strive for cost-leadership through global reach and scale, flexibility and backward integration (eg Global Payments acquiring TSYS, Fiserv acquiring First Data, FIS acquiring Worldpay, Worldline announcing to acquire Ingenico)
2. Pursue niche plays by offering best of class services in a specifically chosen horizontal or vertical market and merchant size (eg Stripe, Braintree, and SumUp focusing on vertical niche markets and typical smaller merchant size)
3. Explore options before, during and after the payment-step in the buying process, to provide a more complete merchant service offering as depicted in figure 5. Examples include PayPal's acquisition of iZettle and Adyen's banking licence for improving their omnichannel offering in their merchant offerings

We also observe the market entry of new parties that integrate the diverse service portfolio of the various PSPs in the world, effectively aggregating PSPs (which were originally aggregating services on their own). Examples include ProcessOut, Alpha fintech, ZooZ, Ixopay and Spreadly. Services typically include optimisation of transaction routing (selecting best fitting PSP for any given transaction), dashboarding key indicators across PSPs and aggregated reconciliation services.

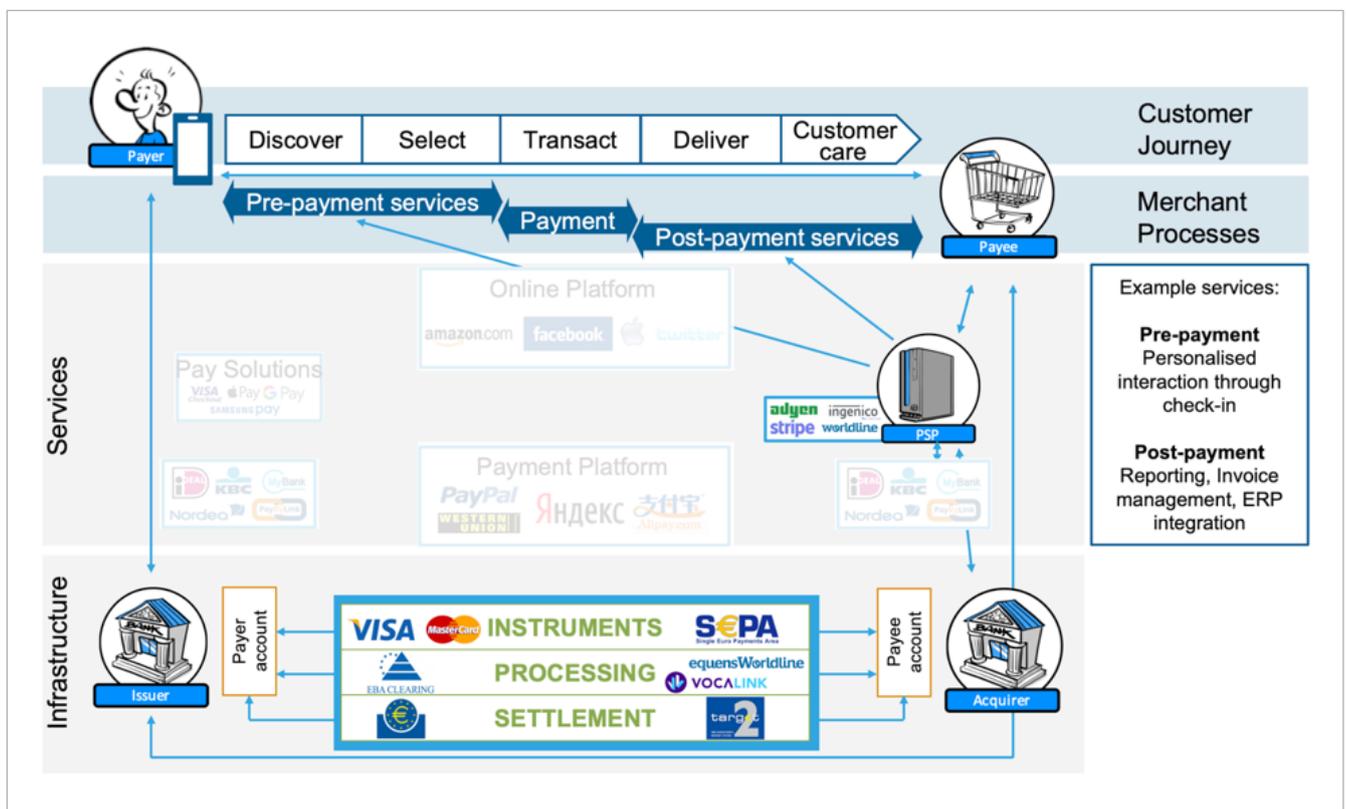

Figure 5: Growth strategy 2: Pre- and Post-payment Services being explored before, during and after payment

→

Innopay

Domain 5: Mobile revolution

The rise of mobile as a consumer channel for payments initiation is the focus of domain 5. The Mobile app has replaced the online web banking environment as the preferred channel for interaction with the bank, as illustrated in figure 6.

The consumers' mobile preference has led to the rise of challenger banks that have a dedicated focus on the mobile channel. Banks such as N26, Revolut and Bunq do not have physical branches for consumers, virtually all banking services are accessible via an app-only approach. These mobile banks have entered the market with compelling customer-centric payment and banking propositions (B2C). Some of these challenger banks are seeking to leverage their technology assets by developing new business propositions (B2B). Examples include Fidor, Monzo and Starling bank that are aiming for business customers with their B2B banking propositions.

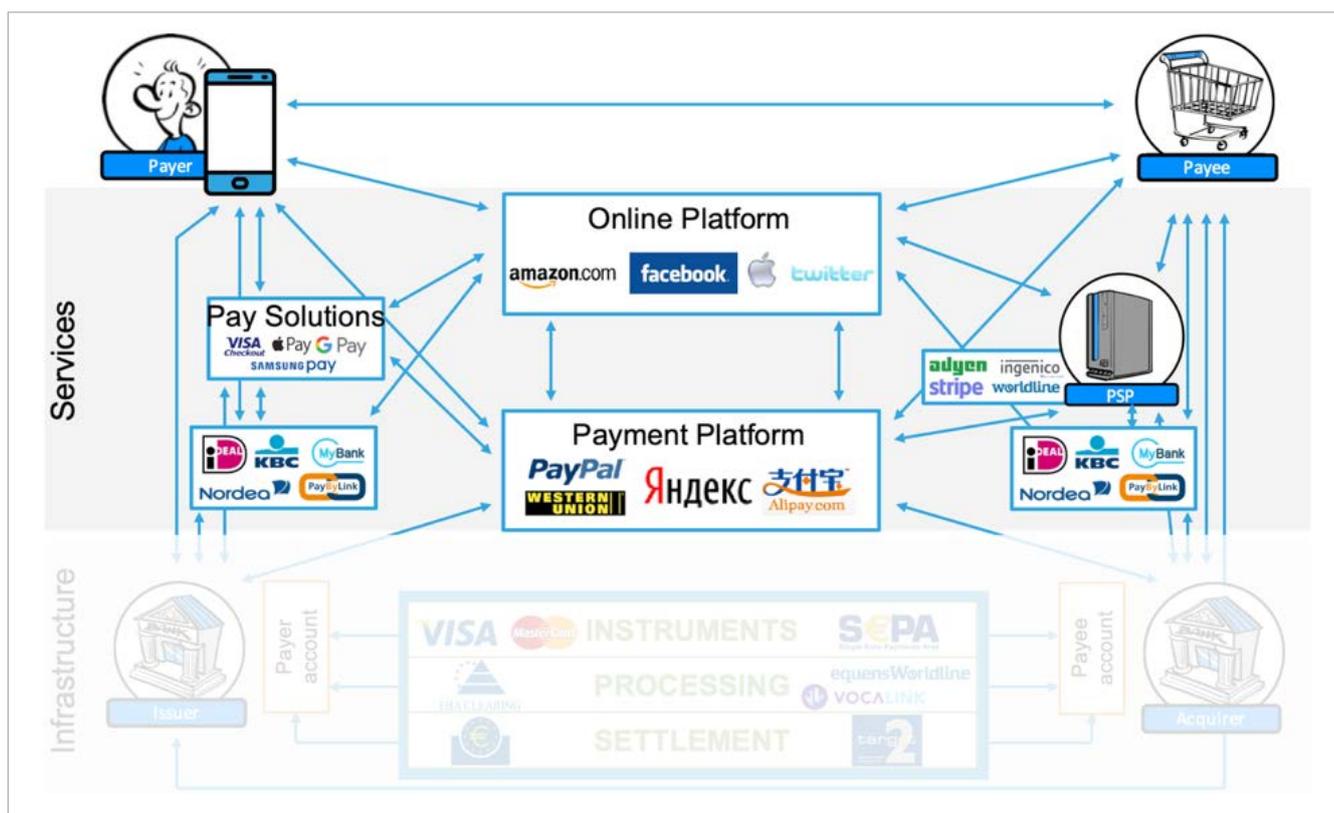

Figure 6: Traditional channels are replaced by new mobile-only channels

→

Innopay

Domain 6: Online continents

Domain 6 covers the rise of online platforms (GAFA & BAT*) for social interaction and commerce. With increased presence in every daily aspect of consumers, these platforms offer their own dedicated payment solutions integrated into their respective platform offerings as depicted in figure 7.

Globalisation provides a need for consumers to transact outside of their own regional scopes. Online platforms are offering services that simplify onboarding to payment systems outside the consumer's own region (eg Alipay offers a wallet solution for non-Chinese consumers to simplify their financial transactions in Chinese commerce markets). Similarly, online platforms are driving acceptance of their payment solutions beyond their core market, driving reach, and ultimately, conversion for merchants.

Being present during every step in the consumer's daily life provides for rich data, enabling sophisticated payment solutions that align with consumer needs beyond the current 'buying process'. In turn, providing payment services to consumers increases the platform's access to consumer data and strengthens its capability in providing relevant value-added services.

Insert online platforms here

→

*GAFA = Google, Amazon, Facebook, Apple; BAT = Baidu, Alibaba, Tencent

Innopay

Domain 7: Payment solutions; previously wallets

Previously, domain 7 covered wallets (aggregating cards) aimed at reducing checkout complexity for consumers. Recently, new payment solutions have entered the market and the wallet domain has expanded beyond card aggregation: P2P payments have really taken off, PSD2 payment services are increasingly emerging and wallets incorporate non-payment related services to further support consumers.

At first, P2P payments were off to a relatively slow start. Consumers were not very willing to pay for this type of service, especially since they were comparing it with payments via OBeP or via Payment platforms, which are considered (virtually) free of charge. However, the popularity of P2P payments is increasing since service providers are reducing (or even removing) costs. They do this by taking the approach of a marketing tool and thus absorbing any additional transaction costs-to push adoption by consumers.

As a next step (towards a profitable business model), these service providers are now looking to move their (free) consumer payment solutions towards the business domain (C2B), capitalising their large customer base to create a revenue model by offering paid services to business customers. For example, the Dutch Tikkie has been a catalyst for the Dutch P2P market (absorbing iDEAL costs normally paid for by merchants), promptly followed by individual banks' P2P offerings (as briefly discussed in domain 3). Tikkie has expanded to the business domain, offering C2B services to generate revenue and a viable business model. Another example is Venmo (owned by PayPal), an American P2P payment solution that started off by absorbing transaction costs to create a user base. It now generates revenue by enabling payments to merchants (and charging transaction fees to merchants).

PSD2 enables consumers to initiate a payment from a licenced third-party application. This can develop in a 'wallet' solution, in which the consumer is able to initiate payments from different accounts through a single application. However, a lack of standardisation in PSD2 interfaces among banks on a European (and often national) level slows down service providers willing to offer such payment account 'wallet' solutions, as it increases cost, complexity and implementation time to create sufficiently high reach. To off-set this burden and complexity we see various technical service providers emerging that take care of the connectivity.

Recent developments in wallets show incorporation of payments with non-payment related services, such as in-app storage for loyalty and discount cards (eg apps such as OK and Reward Cards). This further simplifies the customer journey beyond payments. Domain 9 further covers this development of non-payment services.

→

Innopay

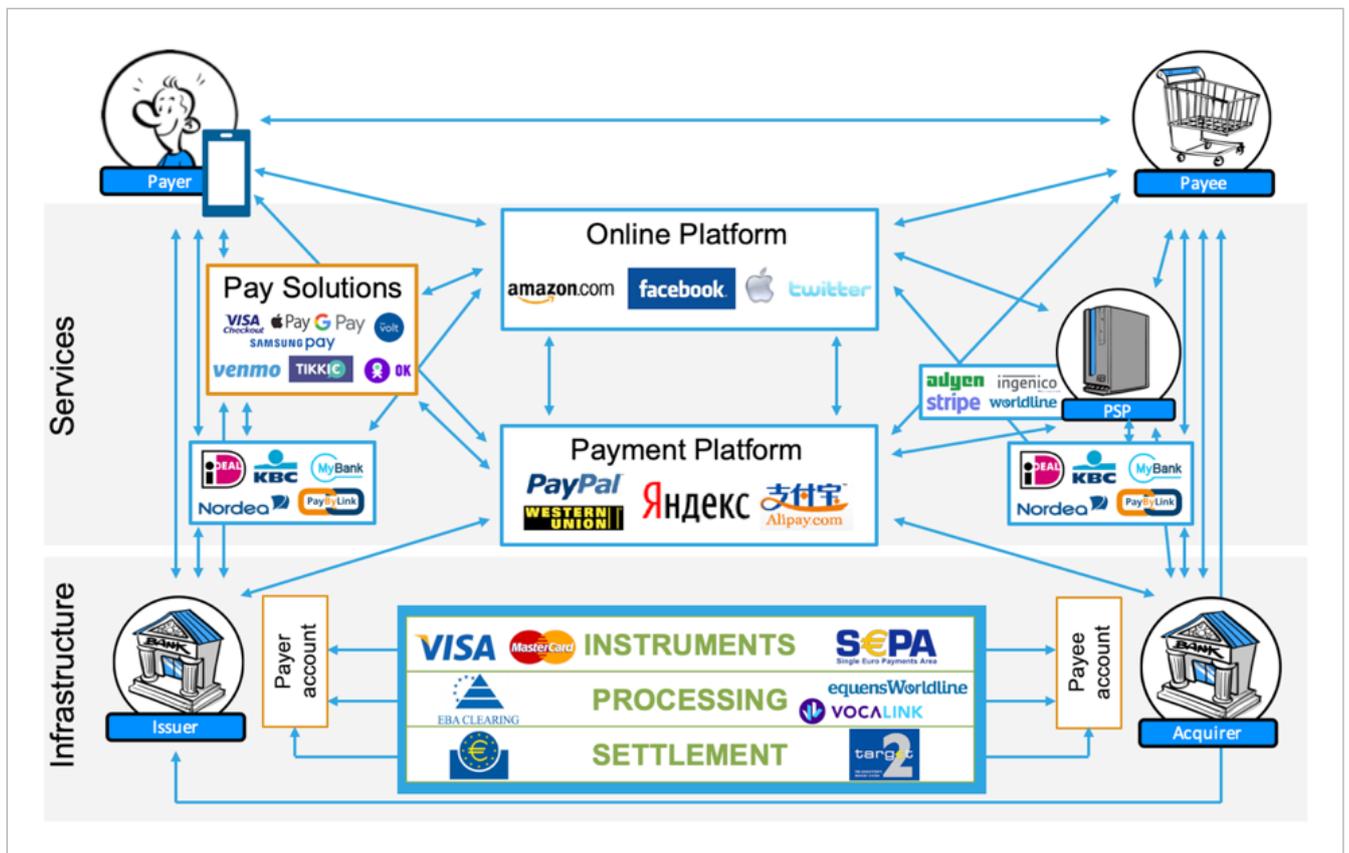

Figure 8: Payment solutions move beyond card payments in simplified check-out processes

Domain 8: Alternative transaction infrastructure

The evolution of the payment landscape as described in domains 2 to 7 always had the initial payment infrastructure from domain 1 as the backbone for innovation. Nowadays the payment infrastructure itself is the subject of innovation, facing potential disruption. While traditional players have initiated new infrastructure initiatives such as instant payments, and are looking at the possibilities that technology such as blockchain can bring to the financial system, non-traditional players are also looking into the development of infrastructure that may heavily impact the traditional financial system.

Non-traditional players are introducing alternatives to the traditional transaction infrastructure, creating a system in which 'service providers' exchange value on behalf of payer and payee through different transaction infrastructures (as depicted in figure 9). This is happening for several reasons, such as to reduce dependency on traditional financial players, capitalise on existing functionalities, accelerate innovation and to shift trust and governance away from organisations and towards a trusted infrastructure instead.

→

Innopay

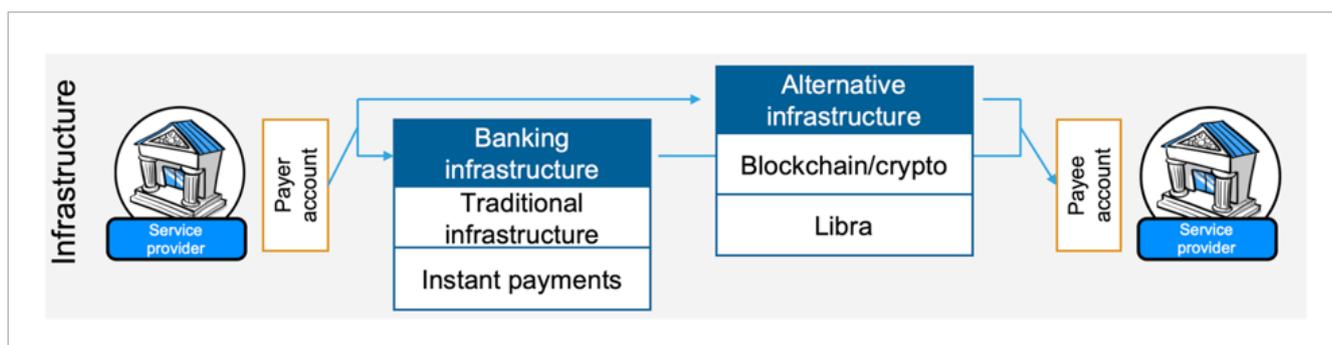

Figure 9: Operation of infrastructure is done by 'service providers' in the payer and payee domain (as opposed to traditional issuers and acquirers)

Alternative transaction infrastructure based on blockchain and cryptocurrency has been around for some years now. In certain situations, this proves valuable (eg recent hyperinflation of Venezuela's national currency), but general adoption as the payment mechanism for everyday purposes is moving slow. A more recent example is the Libra consortium, an alternative transaction infrastructure currently facing heavy scrutiny by governments and central banks for its disruptive potential to the traditional financial system (next to security and governance concerns). At the same time, regulatory authorities are also starting to initiate their own initiatives in the domain of alternative infrastructures; in response to the initiation of Libra, China's national bank is accelerating their development of a digital Yuan (DECP). DECP would offer 'controllable' anonymity and the functionality to replace paper money. Opinions on the viability and desirability of alternative transaction infrastructure vary and the coming years are expected to reveal the real potential of these infrastructures.

Domain 9: Alternative services

The traditional payment infrastructure serves as the foundation for payment-related services. A variety of services exist in a certain layer, but in the end, they result in a traditional payment such as SCT or card transaction.

In the quest for new business models, financial institutions have found new applications for their payment infrastructure. Their interconnected network of trusted and regulated entities, specialised in the exchange of structured data, proves valuable for different types of services besides payments.

Examples on how the existing payment infrastructure can be used for other applications and services include the sharing of personal data for third-party onboarding or log-in actions (eg BankID schemes), but also combining payments with other data streams such as e-invoicing or loyalty and discount schemes (directly connected to payments). Other alternative services include credit services offered to both consumers (eg Payu) and businesses (eg Paypal). By using (historical) transaction information of buyers and sellers to do risk profiling and scoring, parties like Amazon and Paypal are able to provide instant lending services to facilitate payment transactions.

PSD2 accelerates these movements by facilitating easier access to the payment infrastructure for non-financial institutions so that the payment system can be better integrated with alternative services.

→

Innopay

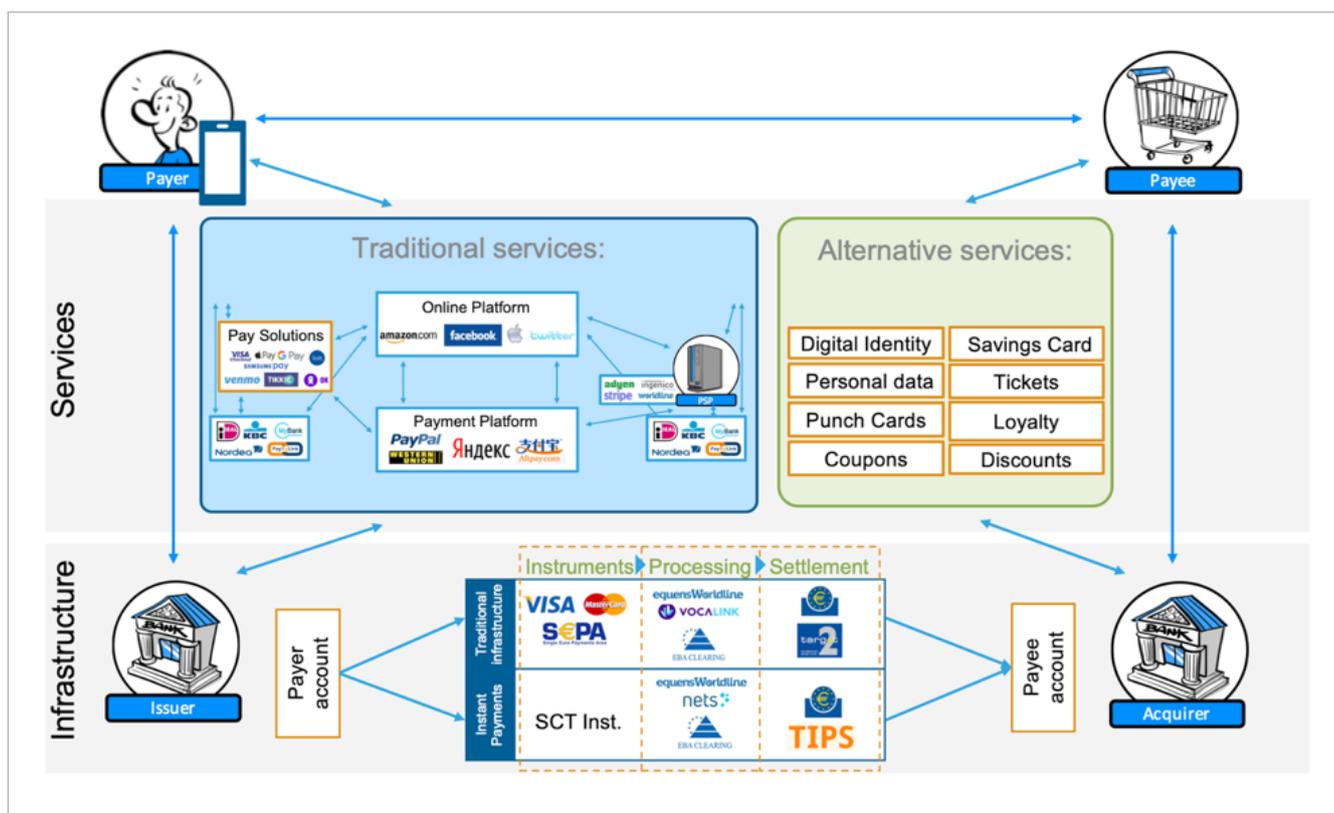

Figure 10: Rise of alternative services on top of existing infrastructure and services

Looking ahead

Integrating payment services with alternative services and data sources is a result of improved connectivity in the digital world. Although not new as a technology, externally exposing services via APIs has seen a rise in popularity in the financial system over the last years. Automated and real-time access to data and services has significantly improved products and services by both financial and non-financial players.

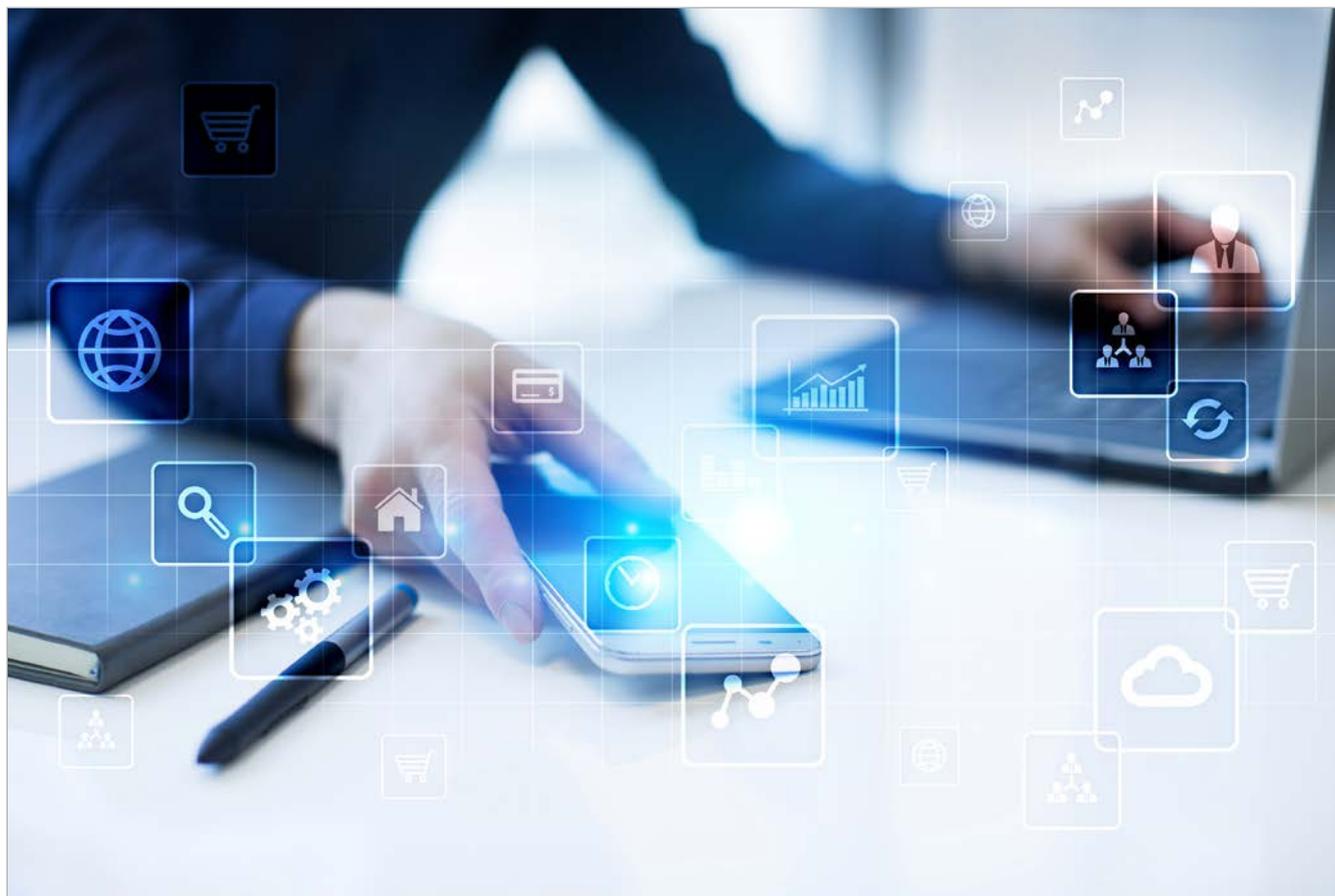

PSD2 is a key enabler for evolution in several of the described domains. Recent years for PSD2 are marked by discussions on (technological) standards and caused the postponement of implementation (of the RTS, regulatory technical standards). A key topic in PSD2 is 'strong customer authentication', which impacts various of the simpler customer journeys that have been important differentiators for parties across the domains in the payment ecosystem. The coming years will show whether the innovation promise of PSD2 will materialise.

The traditional financial system in Europe is still heavily relying on the traditional cards schemes and is under increasing pressure from bigtechs (GAFA & BAT) that are trying to expand their footprint. Indeed, the global payments landscape is undergoing a transformation. Rapid technological advancements, regulatory reforms and rising initiatives, in particular by global digital platforms, have led to changing dynamics. These developments are putting established banks and PSPs under considerable pressure to make a move.

→

Innopay

An interesting recent development to keep an eye on is the launch of 'PEPSI' (Pan European Payment System Initiative). While national payment providers have not been able, or willing, to act in a pan-European manner in the past (eg Monnet, Eaps, Payfair), with the mounting pressure they are in a way 'forced' to do so. PEPSI is an initiative that has set out to develop a pan-European retail payment solution that will be able to compete with card schemes and bigtechs. The initiative is backed by twenty of the largest European banks, and it is supported by the ECB. Looking ahead, this initiative could become an important new development that will have an impact on the further evolution of the payment landscape. However, important success factor will be the willingness of involved players to take a co-ordinated and co-operative approach to establish a pan-European alternative for domestic (card) payment schemes around Europe.

About Annabel Keulen: Annabel is business analyst at INNOPAY. She focuses on strategic projects around PSD2 and Open Banking for various financial service providers and non-financial organisations. Annabel works actively on INNOPAY's TPP Radar to keep track of new TPPs entering the market and the emergence of new value propositions.

Annabel Keulen ▪ *Business analyst* ▪ Innopay

About Christian van Ramshorst: Christian is senior consultant at INNOPAY with a focus on solution design. He combines a background in strategic design with experience in various multi-stakeholder projects such as design of identity schemes, data sharing schemes and collaborative payment services. Christian pragmatically combines business, technology and regulation perspectives when developing suitable solutions for all stakeholders involved.

Christian van Ramshorst ▪ *Senior consultant* ▪ Innopay

About Lex Franken: Lex is Senior Manager at INNOPAY. He has extensive experience in project management, co-creation projects in multi-stakeholder settings, and implementation of solutions in the Banking & Payment sector. Lex was involved in the support & development of the Dutch interbank schemes iDEAL (payments) iDIN (identity) and Incassomachtigen (electronic mandates for direct debits).

Lex Franken ▪ *Senior manager* ▪ Innopay

About Mounaim Cortet: Mounaim Cortet is a Senior Manager strategy at INNOPAY, and Lead for the PSD2 and Open Banking practice. He works on strategic innovation challenges in banking covering digital payments, identity and data sharing. He supports business executives from various financial institutions to navigate the changing payments landscape and develop new insights to (re-)define their business (model) and operational strategy to stay relevant in the emerging Open Banking era.

Mounaim Cortet ▪ *Senior manager* ▪ Innopay

About Innopay: INNOPAY is a consultancy firm specialised in digital transactions. We operate in the areas of data sharing, digital identity, openness, cyber resilience, and digital transformation. Our aim is to help companies, organisations, and consortia across Europe to identify and seize opportunities in a digital world in which everything is becoming a transaction. Together with our clients, INNOPAY experts develop innovation strategies, co-create new products and services, and digitally transform businesses. Our headquarters is located in Amsterdam.

The Paypers

Mergers & Acquisitions in the Payments Industry: From 2019 to 2020

About Anda Kania: Anda is doctor in Political Sciences, currently exploring her research skills to discover the latest trends in the payment and commerce industry. Anda has used her position of senior editor at The Paypers to analyse the hottest topics, and to discuss them with thought leaders in order to get the pulse of the payments environment.

Anda Kania ▪ *Senior Editor* ▪ *The Paypers*

Industry players are partnering, investing in, and acquiring other businesses to keep up with the changing ecosystem that continuously upgrades itself. In order to have a clear picture of the greatest deals and the rationale behind them, we have decided to break down and analyse some of the most significant mergers and acquisitions in the payments space, to share with our readers our view on what they mean for the current business environment, and how they tie in with the current trends. We have extracted five trends that contribute to an organic growth of the whole industry, which seems to go beyond payments:

1. The major card schemes are diversifying their traditional business models and move into account to account payments (banking payment rails);
2. Consolidation – incumbent payment providers strive for control of a greater portion of the payment ecosystem;
3. PSPs are moving up in the value chain;
4. PSD2/SCA regulation becomes a trigger for strengthening capabilities;
5. Global expansion into strategic markets, either established or emerging.

Trend #1 card schemes are diversifying their traditional business models

The heyday of card networks might fade, as alternative payment methods emerge – at a global level, **alternative and local payment methods seem to overpower credit card payments**. We now see Visa and Mastercard, which are the leading card schemes, investing into account to account capabilities.

Mastercard has acquired Nets' Account-to-Account Payment business. With this acquisition, Mastercard seeks to strengthen its

account-to-account real-time payments capabilities. According to the company's statements, this deal also integrates the technical assets and partners added to Mastercard's bill payment capabilities through the acquisition of Transactis.

Visa, instead, has acquired Plaid, a technology platform providing fintech tools to digital financial apps and services, the best-known being Venmo, and to banks as well, to help consumers to connect their financial accounts with their apps. Visa wants to stay relevant in the fintech world by upgrading its capabilities for both FIs and consumers, and Plaid has a major role to play in this matter.

Visa has also finalised the acquisition of Earthport, a cross-border payment services company, which was initially **subjected to a Mastercard's purchase**. Visa aims to help its clients to enable both individuals and organisations to send and/or receive money through bank accounts worldwide. Moreover, the company seeks to further expand Visa Direct's portfolio of use cases, including funds disbursements, peer-to-peer payments, cross border payments, marketplace payouts, and bill payments.

Cross-border payments are still discussed at many levels, whether we are talking about B2B, B2C, or P2P payments. Mastercard has caught on to this dynamic environment and has closed a deal to acquire Transfast, a global cross-border account-to-account money transfer network. Besides complementing Mastercard's payment solutions, the company aims to address the issue of fees to offer a different perception to the cross-border payments and how costly they can be. →

Trend #2 Consolidation – incumbent payment providers striving for control of a greater portion of the payment ecosystem

By consolidation, companies are obviously looking to cost synergies as well, as in removing costs in duplicate functions. In addition, there could be a component of revenue synergies by cross selling new services as well as by providing access to new markets and additional customers.

Fiserv buying First Data has been one of the major events in the acquisition landscape, as two big players have combined their capabilities to create an end-to-end payments platform from issuance to acceptance. This move aims to provide for both payments and financial services, including account processing and digital banking solutions; card issuer processing and network services; ecommerce; and integrated payments. There has been a lot of discussion around Fiserv's acquisitions regarding the outcomes over banks, which might result in fees, extra costs and operational challenges, yet for merchants, this merger might be a lucrative move. Servicing capabilities for Fiserv clients will increase significantly, providing the advantage of negotiating prices for new capabilities, as **Krista Tedder of Javelin states in her article published in [The Paypers](#)**.

FIS has decided to give a boost to its payment solutions by acquiring Worldpay. Both companies are looking to stay ahead of the competition by offering enterprise banking, payments, capital markets, and global ecommerce capabilities. Worldpay is a player in the ecommerce and POS industry, with strong roots in the UK and US, while FIS provides financial services technology, with a focus on retail and institutional banking, payments, asset and wealth management, risk and compliance, and outsourcing solutions.

In order to align with the continuous growth of the US bill pay market (which has driven increased consumer adoption of digital payments), the move to real-time payments, and digital subscription billing, ACI Worldwide has acquired the Western Union's Speedpay. The companies' goal is directed towards a unified bill payment platform designed to unlock new cross-border and cross-currency payments opportunities.

In the first quarter of 2020, Worldline and Ingenico Group have announced that they have agreed upon a business combination where Worldline would launch a tender offer for all Ingenico shares. Worldline seeks to provide a combination of online and in-store merchant services for both SME and global merchants. Moreover, the company plans to expand footprints by offering cross-border payment transactions acquiring.

Trend #3 PSPs are moving up in the value chain

In order to achieve growth, broaden their services to merchants, and save costs, PSPs move up in the value chain. They have started to add acquiring capabilities, develop payment methods, and offer lending solutions to merchants. For instance, Payu, a PSP offering services in growth markets, offers credit to customers not covered by traditional banks.

We have seen some interesting acquisitions in the digital lending space. Mastercard bought Vyze, a consumer financing solution for businesses. At this point, there is not that much to comment on this deal, however, one may emphasise some facts and follow-ups of this agreement. Vyze connects merchants with multiple lenders, allowing them to offer their consumers a wide range of credit options both online and in-store, and Mastercard may now also become a partner for merchants and lenders.

In India, PayU's consumer lending businesses LazyPay and PaySense merged their business operations to build a consolidated digital lending platform in the country. PayU's digital credit platform will enable third parties such as banks, and alternate lenders to co-lend, and will also enable borrowers to access credit. The credit demand in India is projected to be worth USD 1.41 tln by 2022, and there is also a significant rise of digital lending fintechs, so one could say PayU's movement is well thought out.

Trend #4 PSD2/SCA regulation becomes a trigger for strengthening capabilities

In the context of PSD2's SCA long journey, companies are looking to help other businesses to meet the regulatory changes in this respect. →

The payments technology company Stripe has acquired Touchtech Payments, an Ireland-based startup that helps banks to manage Strong Customer Authentication. As mentioned in a [TechCrunch coverage](#), this brings a sea change for Stripe, which has been built on connections with merchants, while Touchtech interfaces with banks and others that handle card payments – so for the first time, Stripe is developing a service that is not primarily focused on merchants but on banks.

Trend #5 Global expansion into strategic markets

Form East to West and vice versa, we see China-based companies entering Western markets and Western companies entering the Chinese market.

In Europe, Ant Financial (part of the Alibaba Group) has bought the UK-based payments company WorldFirst, this being the most significant overseas deal since the company's US expansion – in 2016 Ant Financial bought US-based EyeVerify and in 2017 it bought MoneyGram. The Alibaba Group's subsidiary believes Alipay and WorldFirst complement to offer better payment services to smaller businesses.

An acquisition with the scope of expanding footprints that made headlines for a while, was the one of PayPal buying GoPay, a China-based payment gateway. This way, PayPal has become the first foreign payments platform licensed to provide online payment services in China. A strategic move, needless to say, but it would be interesting to see how this Western payment company can compete with the [super-apps, like WeChat](#) and other popular mobile wallets in China. It's not easy to copy successful models to another market, if we recall [WeChat challenges in India](#), which is a market with consumers already accustomed to social apps, such as WhatsApp, Facebook Messenger, or Truecaller. WeChat's features couldn't compete with existing services and it didn't manage to localise its product for the Indian market. For this reason, any company entering a market where there is already a high penetration of digital payments, should consider an impactful value proposition. So let's wait and see what alternative has PayPal prepared for Chinese customers.

The 'me too' products

In the 'interesting fact'-type news we have the following story. Mastercard bought Ethoca – a favourable move in the chargeback management context, as Ethoca is known in the industry for their collaboration-based technology that enables card issuers, merchants and online businesses to fight against chargebacks. Approximately three months later, Visa acquired Verifi, a company focused on minimizing fraud risk and eliminate chargebacks. So two competitors have bought each other two companies that in turn, are also competitors. Visa is also looking to leverage Verifi's capabilities to complement its own risk management in an attempt to reduce ecommerce fraud.

With the intelligence that Verifi holds, Visa can monitor transactions while making sure the whole process is a seamless one. But the question is, do merchants working with Verifi have something to say here? Are they willing to share their insights with the credit card network? The same question applies to Mastercard.

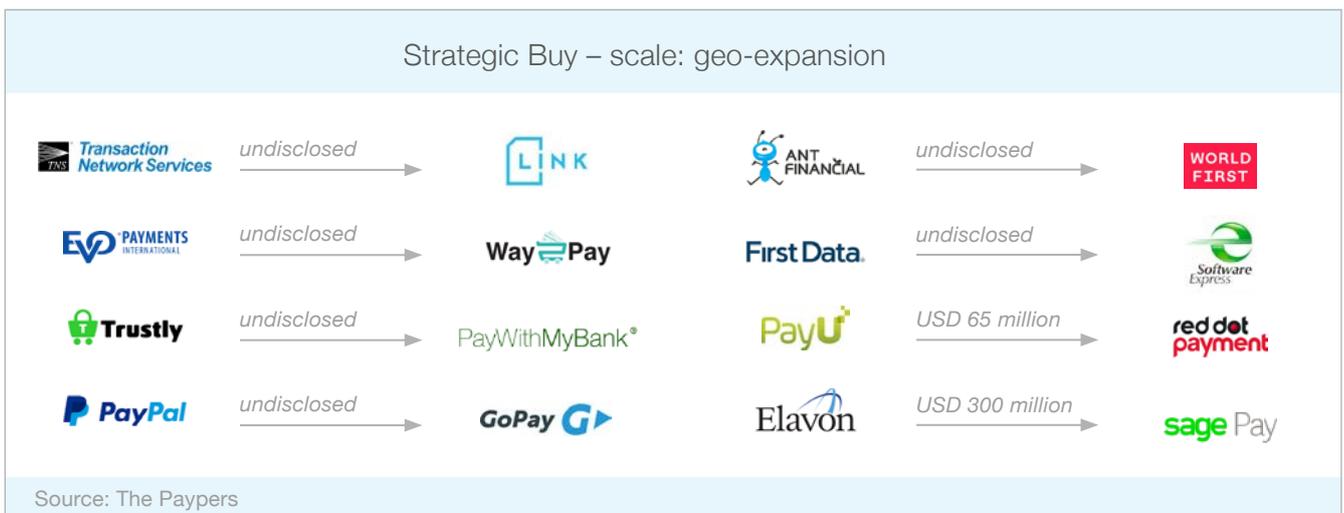

More acquisitions to come, more trends to watch

Surely there will be more strategic buys in 2020 that will remove competition at certain levels – a competitor buying another one, or will increase competition at a high level – once a company adds new capabilities, its services become more valuable on the market, also being able to improve the unique selling propositions. This year we expect further developments of account to account payments with card schemes and banks continuously investing in this capability. We expect card schemes to enter the Request to Pay market, which is a great area of B2B, B2C and ecommerce businesses. Unless a PSP services a great lock-in (still being able to get high margins), the consolidation space is becoming a volume and big data game with continuous acquisitions. Moreover, we should also watch the move beyond payments with digital lending, and, of course, we should also keep the acquisition of startups in sight.

Overview of Strategic and Financial Buys in the Payments Industry

Overview of Strategic and Financial Buys in the Payments Industry

Equistone Partners Europe

How Private Equity Will Drive Payments Consolidation in 2020

About Andrew Backen: Andrew Backen is a Partner at Equistone Partners Europe, having joined the company from PwC Corporate Finance in 2009. Andrew has a particular focus on the Financial Services sector and has worked on investments including A-Plan Insurance, Apogee, Cabot Financial, FirstAssist, and Small World Financial Services. He graduated from Cambridge University with a degree in Chemical Engineering.

Andrew Backen ■ Partner ■ Equistone Partners Europe

2019 was a busy year of consolidation within the global payments industry, with a string of large-cap deals that included FIS' record-breaking USD 35 billion acquisition of Worldpay. 2020 has offered no signs of a lull in M&A activity. Worldline's USD 8.6 billion acquisition of France-based digital payments provider Ingenico, announced in February 2020, fired the starting gun on further, industrial-scale consolidation of European payments this year.

Multiple strategic rationales have driven, and will continue to drive, the ongoing consolidation of the payments industry. Chief among these is the search for scale. Currently, the global payments market remains relatively fragmented. A clear opportunity exists to step-change the scale of businesses through M&A, perhaps to establish a leading market position. For example, Nets' merger with Concardis Group, completed in January 2019, created a business with approximately EUR 1.3 billion of net revenue across Germany and the Nordics, making it one of Europe's largest payments groups.

Payments companies are also seeking assets that can diversify their customer base and customer offering, by expanding into complementary geographies and services respectively. PayPal announced two purchases in 2018 exemplifying this approach: the USD 2.2 billion acquisition of iZettle, which provided access to the company's established POS capabilities in new markets including Sweden and Latin America, and the circa USD 400 million acquisition of the global payout platform Hyperwallet, enhancing PayPal's suite of payment solutions for ecommerce platforms and marketplaces.

Alternatively, payments companies might look to add entirely new, high-growth business areas through M&A, rather than developing

these platforms from scratch. Visa's acquisition of cross-border payments company Earthport in 2019 provided the US-based payments technology provider with a stronger foothold in the substantial account-to-account payments market.

The inflow of investment from private equity firms

These various types of strategic transactions fuelling consolidation within the global payments industry have not just been limited to large-cap acquisitions by public-market giants. The mid-market, which might be tentatively defined as comprising companies valued below USD 500 million, also continues to be very active. And a striking trend within the mid-market of the payments industry is the inflow of investment from private equity firms to drive this consolidation.

Certain larger private equity firms do invest in large-cap transactions; for instance, the Nets-Concardis merger was backed by private equity investors Hellman & Friedman, Advent International, and Bain Capital. However, it is in the mid-market that private equity firms are perhaps most actively deploying capital to both acquire payments businesses and then support these companies with 'add-on' acquisitions.

At Equistone, for example, having invested in Small World Financial Services, a leading UK-based money transfer company, in November 2018, we subsequently supported Small World with the add-on acquisition of France-based international payments company MoneyGlobe earlier in 2020. The transaction addresses two of the key strategic rationales, adding a complementary geography through MoneyGlobe's coverage of its domestic French market and generating further scale for the business. →

In this respect, private equity is an excellent partner for mid-market payments companies seeking to grow acquisitively. Many private equity firms regularly support 'buy-and-build' strategies at their portfolio companies, contributing not only capital, but also their established networks for originating new deals, their financial and technical expertise, and their experience in executing M&A including post-deal integration. But if mid-market payments companies' appetite for participating in the ongoing industry consolidation is set to continue, what factors are attracting private equity investors to help fund and drive these acquisitions?

Key factors attracting private equity investors

Alongside a highly amenable landscape for supporting a buy-and-build strategy, into which private equity investors can deploy their record 'dry powder' reserves of unspent capital that Preqin estimates at almost USD 2.5 trillion, we see three key drivers.

Firstly, the payments industry offers the growth potential to support strong returns for private equity firms' underlying investors. McKinsey has forecast that global payments revenues will reach USD 2.9 trillion by 2022, with cross-border payments driving this expansion and growing by 74% by 2026.

Secondly, the industry is being transformed by ongoing digitalisation. Whilst in some sectors of payments – and countries – more traditional routes to market will endure for a long time, supporting a company through a successful digital transformation is a clear pathway to creating value. An example of this at work is Global Blue, a leading Switzerland-based international provider of traveller tax refunds. The company was acquired by Far Point for USD 2.6 billion in January

2020, having previously been jointly owned by private equity firms Silver Lake and Partners Group and, before that, by Equistone. Global Blue fuelled its growth, with EBITDA growing from circa EUR 35 million to circa EUR 97 million during the period of Equistone's backing, in part by successfully digitising transactions such as VAT refunds.

Thirdly, active industry consolidation and corporates' interest in acquiring payments businesses presents private equity investors with an attractive exit environment when they seek to sell the companies in which they invest. Increasing competition on the buy-side and the steadily diminishing number of high-quality assets available as consolidation rolls on both serve to support asset valuations.

Accordingly, trade buyers from across the globe were aggressive in acquiring private-equity-backed payments companies in 2019. This ranged from US-based Mastercard buying the real-time payments arm of Nets, shortly after the company's merger with Concardis, for USD 3.2 billion, to Ant Financial, the payments arm of Chinese internet giant Alibaba, moving into Europe through the USD 700 million acquisition of UK-based WorldFirst.

Strategic acquisitions for a range of rationales, upward pressure on valuations, and continued investment from private equity have emerged as some of the key dynamics within the global payments industry in recent years. All indicators point to M&A continuing at pace in the coming year, as payment providers seek to raise private equity investment, drive further consolidation, and attract interest from strategic buyers.

About Equistone Partners Europe: Equistone is an independent private equity firm founded over 40 years ago. It typically invests between EUR 25 million and EUR 200+ million of equity in mid-market businesses and generates returns by supporting these companies' growth, both organically and by acquisition. Equistone has offices in France, Germany, the Netherlands, Switzerland, and the UK, and provides its capital and the deep experience and networks of its local teams to support growing companies.

Startups to Watch

Startups to Watch in 2020 and Beyond

Who would have thought that someday we would undoubtedly say that unicorns exist? Yes, they do exist in the payments world and they all strive to gain the upper hand, fed by a tremendous ambition of disrupting the entire ecosystem. The roadmap from a startup to a unicorn is not a beaten track, but it's encouraging to see that small companies gain enough trust from the investment companies, so they can further work on their value propositions.

Based on the investments startups received and the solution they offer on the market, we have created our list of startups to watch in 2020 and beyond.

Startups classified as PSPs

Checkout.com is an international provider of online payment solutions. They process more than 150 currencies and offer access to all international cards and preferred local payment methods to merchants through one integration. In May 2019, it raised USD 230 million in series A. In 2020, it made its first acquisition with ProcessOut, aiming to offer global merchants better performance and more options to manage their payments needs.

Satispay is a payment platform that enables consumers to pay in affiliated stores, both online and offline, to exchange money with friends and set aside small amounts of money. The company also offers ecommerce plugins and customised links for online stores to receive payments. In 2018, they received a EUR 15 million Series B funding round. In February 2019, it was listed in the top 5 hottest startups in Italy.

Fintech-as-a-Service startups

Airwallex, which is backed by Facebook, Airbnb, Spotify, is building global financial infrastructure for internet companies. Customers can create international bank accounts instantly, access interbank exchange rates, and send money through local and international clearing networks. In 2019, they received USD 100 million in Series C funding round. According to [CNBC](#), it is Australia's fastest-growing USD 1 billion startup.

Rapyd enables merchants, gig platforms, challenger wallets, remittance platforms, digital lenders, and traditional banks to remove their traditional infrastructure and create new mobile-friendly solutions. In 2019, it received funds in three series: Series B of USD 40 million by Stripe, Series C of USD 100 million, and another Series C in December of USD 20 million.

Payment-as-a-Service startups

Flutterwave currently operates in over 40 African countries, providing payments technology and infrastructure to the continent's largest financial institutions. In January 2019, it launched, together with Visa, an African consumer payment service, GetBarter. In January 2020, it received USD 35 million in Series B funding.

An ASX listed startup, **Sezzle**, provides a payments platform that facilitates payments between consumers and retailers, allowing end-customers to make online purchases and split the payment for the purchase over four equal, interest free, payments over six weeks. In 2019, they raised USD 100 mln in a Post-IPO Debt round.

Finix is a payments infrastructure platform that facilitates real-time push-to-card payments. In July 2019, it raised USD 18 million in Series A from Visa and in February 2020 it got USD 35 million in a series B funding. →

Startups to Watch in 2020

Capitalising great partnerships

We have the pleasure to introduce you a startup that we had the opportunity to discuss with – WL Payments, a [Newgen](#)-launched company that provides managed solutions for online payments, ecommerce optimisation, and fraud prevention to merchants, financial institutions, and retailers. In January 2020, WL Payments partnered with Bankingblocks, a wholesale banking provider for fintech and payment companies. Bankingblocks has chosen WL Payments as their gateway technology block due to the unique nature of their platform, cross-services capabilities, and similarities in the companies' visions about the future of payments. Later on, in February 2020, the startup partnered the payment processor Link4pay. The company has chosen WL Payments as their gateway technology provider for card and alternative payment processing because it fulfils Link4Pay's growth objectives.

We sat down with WL Payments and they revealed to us what problems in the market they aim to solve, the background of their core team, their value proposition, and their key customers, all of this information gathered in a short interview below.

WL Payments

What triggered the foundation of the company and what problems in the market it aims to solve?

WL Payments was founded to address the many gaps in the current market of payment platforms. Automatic reconciliation, data insights that improve success ratios and fast integrations are just a few of those gaps. Companies offering payment services can offer our platform and solutions fully customized to their company's brand, look, and feel to their customers. We make sure that our partners spend less on keeping up with payments' technology and regulations while ensuring that their customers have a frictionless payment experience. We deliver integrations into new channels and markets and bring the switching costs and time to an absolute minimum. We talk about hours and days where others talk about months. Of course, our intelligent transactions routing engine, along with other conversion boosting features, help online merchants increase the success rate of their payment transactions. In addition, our automated reconciliation module cuts down their accounting costs significantly. We aim to make sure that the entire payment process is optimized for all parties involved.

Can you share with us the background of your core team?

The team is a mix of banking and payment industry veterans and a team of young highly skilled developers who have been with the company since they were interns and now are IT payment specialists themselves.

How is your core product/service different from other platforms on the market?

Our partners and their merchants tell us that our dashboards give them actionable insights they have not seen before. We focus on using data to improve success ratios. AI and BI are not new to us. Furthermore, we see our clients as true partners. When we sign a contract, then we make sure that we, together with our partner, deliver on what was promised. We live by the following rule: we grow only when our partners grow! WL Payments is a newly developed platform based on the learnings in developing payment gateway solutions over the past few years. We have been focusing on building technology that is easy to adapt and integrate. WL Payments is built to accommodate the ongoing trend of open banking and provide more technological convenience to an increasing number of industry players.

Could you please name few key customers?

BankingBlocks, Link4pay, Easyforex.

Sunil Jhamb
Founder and CEO
WL Payments

About Sunil Jhamb: Sunil is the Founder and CEO of Newgen Payments and WL Payments, a fintech providing cutting-edge solutions to PSPs, acquirers, financial institutions and ecommerce merchants. He is responsible for running all facets of the business. Sunil has a proven management track record and over 20 years' experience in international business consulting and sales. Prior to founding Newgen Payments, he was responsible for GlobalCollect's (currently Ingenico) global sales planning and strategy, where he developed corporate strategies that drove new revenue opportunities.

About WL Payments: WL Payments offers an award-winning, modern & modular payment gateway platform as a White-Label solution for ISOs, PSPs, Acquirers, and Merchants. Co-branded under your company's identity in offering APIs, Merchant Portal, Payment Pages. Plus conversion-boosting features such as One-Click Payment, Intelligent Routing, In-depth Reporting, Reconciliation, Risk Engine, and many other features.

Choosing the Right Payments Partner

STRATGranat

Has the Time to Change Payment Partner Arrived?

About Catherine Tong: With over 20 years' experience, while at PwC, Tesco and Accertify, Catherine is now an independent fraud, risk and payment specialist with STRATGranat. Previous projects include complex fraud investigations, Global internal audit programs, and setting up and managing ecommerce fraud and payment teams. She has also served as a European Board member for the MRC and is currently an Ambassador for the European Women in Payments associations.

Catherine Tong ■ Partner ■ STRATGranat

About Rossini Zumwalt: Rossini defined payment and risk strategy, and led a global team in eCommerce and Treasury for over 20 years, at Symantec-Norton, Emergent Payments and now, sharing leading practices with merchants and solution providers as a co-founding partner at STRATGranat and sharing her experiences. She served as Global Board and European Board Chair for the MRC.

Rossini Zumwalt ■ Co-founding partner ■ STRATGranat

Most of us have resigned from our job at some point in our lives. Making the right decision can be a very stressful process, but equally very rewarding. Something has triggered us to take this bold action – sometimes as a result of an external event, sometimes proactively to change the course of our career path, and it is certainly a normal aspect of modern life. Although we often strive for stability to minimise fear of the unknown, as soon as we have this, we get bored and in time we fall behind or get frustrated.

So, before we even consider how we choose the right payment partner, it is worth thinking about why change should be considered in the first place and how each of us as individuals encourages or reacts to change. Below are three areas to consider:

Make a difference

As humans, at some level, we want to be noticed. This is not necessarily mean being on TV or the front page of a newspaper. It could be as simple as being involved in a local fundraising activity or helping a neighbour. Being recognised for doing something positive makes us feel good.

Often when we take on a new role, we want to make our mark. We want our new boss to feel like they made the right decision. This may be

sharing your knowledge and expertise to help the business make informed decisions, bringing new ideas and solutions to the table or helping drive stronger results. As different stakeholders will want different things, it is likely that your difference will take many forms. In business though, the decisions which get noticed and recognised are the ones which have a strong financial impact.

On the flip side, when you are in a role for a while, you need to be more aware of getting too comfortable. In this situation, the world around you will be changing and you are in danger of becoming complacent or unaware of the opportunities that are out there. Which leads us on to.....

Spot innovation

Are you a trend-setter or a follower? Do you want to be leading the charge on the great new thing, or would you rather follow the lead of someone else and not put yourself at risk of making a mistake? It is also likely it will involve more than your perspective to determine which category applies to you.

In either case, go out and seek new ideas or technology. If you find you rarely leave the office, how do you keep your knowledge up to date? →

Love it or hate it, the cold call from a salesperson wanting to come and see you, if carefully vetted, can also help you gain this insight. Be broad-minded. Try not to assume that you know an outcome or how things work as innovation might just surprise you. Listen more than speak is a key asset here.

Having sustained stability will mean missing out on new thoughts and ideas for the sake of keeping the status quo. Stability can itself bring risk as others strive to “do better”.

Respond to pressure

External forces will also influence your motivation for change. For example, in the workplace, pressure may come from your Executive team. They may be approached by a vendor or hear about a topic and have a view on how you should react. Using this to challenge your own knowledge is important, as well as having the tools in your armoury to bring your expert perspective.

Remembering that pressure can also come from key metric performance is also key. Looking at numbers without having the context and benchmarking can be a dangerous approach to take, so being on top of your numbers and being able to tell the story behind them is a very important skill or change may be driven by a need that will not be satisfied.

Consider as well, the pressure you may have to buy. In any aspect of life, the primary goal of a salesperson is to sell. A sale is more likely to happen if you have a good personal connection with that individual. This, in turn, could mean that the basis of your decision is the people you interact with, rather than the solution being offered.

Once you have decided that change is needed, consider the traps we can all fall into when making decisions – considering sunk costs, confirming evidence for your idea, inaccurate forecasting for example. Especially when evaluating different options, unconscious bias can scupper making the right choice.

Ultimately, who knows whether any decision is the “right” decision. In addition, this will likely vary depending on the context you are considering it in, and true consensus, even alignment, is a bit of an enigma. Taking a broad perspective, knowing what problem you are trying to solve, and understanding the pros and cons under consideration are good starting points to ensure you ultimately help move onwards and upwards.

In the payment world, some questions worth asking yourself are:

- How long have we had our current suppliers?
- What is the performance so far – good, bad or unknown?
- What are their product and/or service strengths and weaknesses?
- How do I start to learn and adapt to the latest industry trends?
- Who are the new or innovating players in the marketplace?
- How are these players different?
- What are the industry benchmarks and how do I compare?

Conducting and starting with this simple assessment will help set you on the right path to determine the next action for you. But what next? You should definitely connect with your payment peers, attend an industry network event, read this The Paypers` Guide, and if you’re still unsure, there’s always the option of an RFP. Whatever that might be – it must NOT be “status quo”.

About STRATGranat: STRATGranat aims to be the Payment sector service company. It supports fast growing Payment sector companies with a very horizontal portfolio of 100 packaged services, Strategic, Operational or HR related. Its credibility is based on 25 experts with more than 15 years of experience in their fields, who have worked for 100 tier-1 companies.

Payments Ecosystem Explained

Introduction

As the payments ecosystem has increased in complexity, choosing the right payment partner for your business can also be a difficult process. The key criteria to consider payments services provider are usually the price transparency, payment methods coverage, technology, verticals, geographical reach, and reliability. The latter may be subjective and depending on the community reviews, however, by analysing the rest of them, one may take a good decision according to the business needs.

We have compiled several solution providers with their capabilities and displayed them in a precise manner via a synthetic infographic and a comprehensive mapping. But first, let's see what's the role of these players in the current payments space.

Payment Service Providers (PSPs)

PSPs mainly enable businesses to accept online payments, offering merchants an interface that opens up for one or more payment methods.

There are three types of PSPs:

Distributors – They build and maintain the connections to many different payment methods. By connecting to one distributor, an online merchant will be able to accept multiple payment methods.

Collectors – They add a single settlement process for different payment methods. By combining all payments into a single settlement, payment reconciliation is thus simplified.

Aggregators – They accept payments and collect the funds on behalf of the merchants by contracting with the individual payment methods.

Payout solution providers

Payout Solution Providers are players that specialise in global mass payout solutions. They offer their services to merchants that need to pay users of their marketplace or service platform, e.g. people selling items on a marketplace like eBay, or drivers for services like Uber or Lyft.

A mass payout solution stands out according to its features that complement the execution of payments. Some of the key features include payee onboarding, payment detail validation and verification, tax form collection, ERP integration, and payment reconciliation.

Payment as a Service (PAAS) Providers

A Payment as a Service provider offers IT platform solutions as a solution provider to banks, acquirers, PSPs and merchants, possibly supplemented with managed services: the implementation of one or more operational processes, such as customer onboarding, customer service or fraud handling. PAAS providers reduce the complexity of managing multiple acquirers, PSPs, payment methods and so on. They typically offer one single API to manage (orchestrate) payment flows and provide a single dashboard and reconciliation and settlement.

Enablers

Enablers are players that offer several services or capabilities to PSPs in order for them to render payment services more effectively. The services provided by enablers vary from offering connections to card acquirers and APMS, to processing and collecting services for APMS, and a wide range of other value-added services, e.g a payment account, acquiring services, etc.

Financial infrastructure

PSPs, acquirers and banks can enhance their proposition by partnering with companies offering global banking solutions. By partnering with these companies PSPs are able to offer a more integrated service offering to their merchants. Examples of services offered: instant settlement, lending, virtual IBANs, FX, cross-border payments and bank accounts.

What is the biggest single source of third party ancillary revenue?

Continuum's Multi-Currency Conversion services can generate more third party ancillary revenue than commission on hotels, car rentals, or insurance.

Foreign exchange margin gain (typically 3% to 5%) otherwise lost on cross-border transactions

Increased 'look-to-book' conversion rates of 20%+

Increased Average Transaction Value of 8%

Fully Managed foreign exchange services

Fraud prevention (measures)	<p>A tailored suite of online fraud prevention tools to choose from, shaped around your business' needs:</p> <ul style="list-style-type: none"> - Artificial Intelligence: Advanced BI systems create and monitor real time transactions - Generating behavior maps, monitoring patterns in sales data and identifying any anomalies that could indicate fraudulent activity, before a transaction is even completed. - Device Fingerprinting: A key tool in credit card fraud prevention. Identify users or devices and be alerted to their return to your site, even if using a different IP address, browser or untracked cookies. - Cross-merchant Intelligence: We develop negative databases of previous fraudulent user profiles from other merchants that we work with, allowing us to spot fraudulent users across merchant pages. - IP Geolocation Tracking: As well as identifying fraudulent users, we can pinpoint where they are located in the world and spot them when they arrive on your site in future. - Merchant-Controlled Rules: Tailored transaction or behavior rules exclusive to your site or payment process. Merchants are alerted when these rule conditions are broken to identify fraudulent activity. - Industry and Sector-Specific Risk Profiles and Rules: Tailored transaction or behavior rules based on our industry and sector experience. Merchants are alerted when these rule conditions are broken to identify fraudulent activity. - Dynamic 3D secure including compliance module to facilitate compliance to PDS2 regulation.
Fraud prevention partners	We work with a wide range of partners including rule-based and artificial intelligence.
Credit management (services)	N/A
Other services	Payment Performance Analysis, Solution Consultance, FX management, Dispute management, Fraud tools, integrations with shopping carts, booking engines etc.
Third parties	Ingenico ePayments has built a global network of industry partners, including leading technology and eCommerce platform providers, reservation systems, shopping carts, integration service providers, and other complementary service providers.

Technology

Direct connections	Yes
Batch processing	Yes
Per order processing	Yes
Merchant pages (direct model)	Yes
PSP pages (redirect model)	Yes
Interface	The Interfaces available to merchants are XML-based interfaces over HTTPS, and API extensions that include a core RESTful/JSON API, and JavaScript and native mobile client SDKs.
Security	All transmissions over the public web are using encrypted channels like HTTPS, VPN or encryption using certificates (encrypting the message). Internally data is moved with secure copy techniques like OpenSSH and sFTP. Merchant's (server) authentication data is hashed, and other information will be sent to Ingenico through a secure connection using HTTPS/SSL (TLS1.2 only). The certificate used to set up the HTTPS is at a minimum SHA2 with a RSA key of 2048 bits.

Connect to New Possibilities

Ingenico works with you to navigate the complex ecosystem of finance and technology to maximize the benefits to your business. We connect businesses to new possibilities through payments.

Simplify local payments and boost global sales with PPRO

Commerce is becoming increasingly cross-border. Retailers see e-commerce as a way to enter new markets with lower up-front investment. And customers are looking internationally for a wider selection of goods and lower prices.

Yet, as commerce becomes more global, payments are going the other way: Every region has their preferred ways to pay. In fact, only 35% of online payments worldwide will be made with a plastic card by 2022, according to the Worldpay Global Payments Report 2018. Businesses who only accept cards stand to miss out on sales, simply because customers cannot pay them.

If you're thinking that accepting local payment methods sounds complicated, you're right. Which is why PPRO exists. We remove the complexity of cross-border and domestic digital payments. We acquire, collect and process local payment methods across 175 countries.

One contract, one integration, one settlement.

For more information or to discuss your particular local payment requirements, get in touch at sales@ppro.com.

Company	ProcessOut
	<p>ProcessOut offers a monitoring and smart routing solution for payments. We help online merchants build, scale, monitor, and optimise their payment infrastructure. Through one API, our Smart Routing solution gives merchants access to any payment API. Each transaction is dynamically routed to the most relevant provider to optimise authorisation rates and payment fees. Our monitoring solution is plug & play and can be used on top of our smart routing solution or on any payment infrastructure. Merchants get access to a centralised hub for their payment data with advanced analytics tool designed for payments and algorithm-based recommendations to improve your payment performance.</p>

Glossary

Glossary

Account-to-Account payments (A2A)

An alternative payment method that covers a variety of use cases, from peer-to-peer payments through apps to wire transfers, to Automated Clearing House (ACH) payments. To complete a transaction, an individual must know the recipient's account number or other identifying details.

Alternative payment methods

All the payment methods that are used as an alternative to credit card payments and are not running on global scheme networks such as Visa, Mastercard, or American Express.

Application Programming Interface (API)

A set of programming techniques (web API, remote API, SDKs, libraries, frameworks, and more) that are available for software developers when they integrate with a particular service or application. In the payments industry, APIs are usually provided by the participants in the money flow (e.g. payment gateways, processors, service providers) to facilitate the money transferring process.

Banking-as-a-Service (BaaS)

An end-to-end process that allows licensed banks to integrate their digital banking services directly into the products of other non-bank businesses. This way, a non-bank business can offer its customers digital banking services without the need of acquiring a banking licence of their own.

Business-to-Business (B2B)

A form of transaction between businesses, such as one involving a manufacturer and a wholesaler, or a wholesaler and a retailer. B2B transactions tend to happen in the supply chain, where one company will purchase raw materials from another to be used in the manufacturing process.

Card scheme

A payment network that manages and controls the operation and clearing of card payment transactions according to card scheme rules. The card schemes are responsible for passing card transaction details from the acquirer to the issuer and for passing payments back to the acquirer, which in turn pays the merchant. Some examples of card schemes are American Express, JCB, UnionPay International, Mastercard, and Visa.

Cross-border ecommerce

Refers to international ecommerce – consumers buy online from merchants located in other countries and jurisdictions.

Digitalisation

The use of digital technologies to change a business model and provide new revenue and value-producing opportunities; it is the process of moving to a digital business.

Ecommerce

Short for electronic commerce – a broad concept that includes virtual browsing of goods for sale, selection of goods to buy, and payment methods. Ecommerce functions on a bona fide basis, without prior arrangements between customers and merchants. It operates via the Internet, using any combination of technologies designed to exchange data (such as EDI or email), access data (such as shared databases or electronic bulletin boards), and capture data (through bar coding and magnetic or optical character readers).

EMV

The international smart card standards group made up of Europay International, Mastercard International, and Visa International.

Financial inclusion

An effort to make every day financial services available to more of the world's population at a reasonable cost. Advancements in fintech, such as digital transactions, are making financial inclusion easier to achieve.

Fintech (financial technology)

New technology that aims to improve and automate the delivery and use of financial services. At its core, fintech is utilised to help companies, business owners, and consumers better manage their financial operations and processes by utilising specialised software and algorithms that are used on computers and, increasingly, on smartphones.

→

Glossary

Marketplace (online)

A type of ecommerce website where product or service information is provided by multiple third parties, whereas transactions are processed by the marketplace operator. Online marketplaces are the primary type of multichannel ecommerce and can be a way to streamline the production process.

Mobile point-of-sale (mPOS)

A smartphone, tablet, or dedicated wireless device that performs the functions of a cash register or electronic point-of-sale.

Payment-as-a-Service (PaaS)

A phrase used to describe a Software-as-a-Service to connect a group of international payment systems. The architecture is represented by a layer – or overlay – that resides on top of these disparate systems and provides for two-way communications between the payment system and the PaaS. Communication is governed by standard APIs created by the PaaS provider.

Payment gateway

A technology used by merchants to accept debit or credit card purchases from customers. The term includes not only the physical card-reading devices found in brick-and-mortar retail stores, but also the payment processing portals found in online stores. However, brick-and-mortar payment gateways in recent years have begun accepting phone-based payments using Near Field Communication (NFC) technology.

Payment processor

A company (usually a third party) contracted by a merchant to handle transactions from various channels such as credit cards and debit cards from merchant acquiring banks.

Payment Service Provider (PSP)

An organisation that provides a secure payment page for a merchant's customers to enter their card details and which passes these on to the merchant's acquirer for processing. The PSP may also offer a 3-D Secure service such as Mastercard's SecureCode or Visa's Verified by Visa.

Payment switches

Payment switches are transaction-based software systems that can be built internally or bought off-the-shelf. Using merchant-driven rules, switches dynamically route payment transactions between multiple acquirers and Payment Service Providers (PSPs) end-points. Examples of these rules could include: retry of declined transactions, routing by lower cost, routing by time of day, routing by BIN, and routing by amount. (source: Paladin report)

Payout

The ability to initiate outbound payments.

Private equity firm

A private equity firm is an investment management company that provides financial backing and makes investments in the private equity of startup or operating companies through a variety of loosely affiliated investment strategies including leveraged buyout, venture capital, and growth capital. Often described as a financial sponsor, each firm will raise funds that will be invested in accordance with one or more specific investment strategies.

SaaS (Software-as-a-Service)

A software delivery model in which a software is provided on a usage, duration, or frequency basis rather than as a one-time license.

Don't Miss the Opportunity of Being Part of Large-Scale Payments Industry Overviews

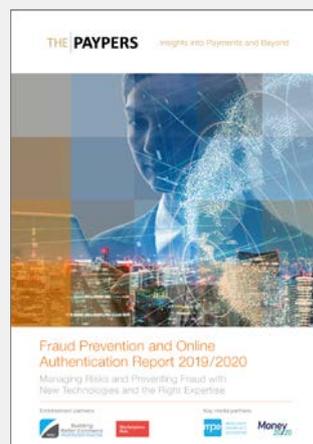

Every year, The Paypers releases large-scale industry overviews covering the latest trends, developments, disruptive innovations and challenges that define the global online/mobile payments, e-invoicing, B2B payments, ecommerce and web fraud prevention & digital identity space. Industry consultants, policy makers, service providers, merchants from all over the world share their views and expertise on different key topics within the industry. Listings and advertorial options are also part of the Guides for the purpose of ensuring effective company exposure at a global level.
